**Android Studio 4 & Android 10  
Setup Tutorial - Mac**

## Android Studio Tutorial - Mac Users

### Content

<b>Content</b>	<b>1</b>
1. Download Android Studio (version 4.1.0 or newer):	1
2. Install it	1
3. Open an existing Android Studio project.	2
4. Create an Android Virtual Device (AVD)	3
5. Run the App	5

## 1. Download Android Studio (version 4.1.0 or newer):

<https://developer.android.com/studio>

Android Studio provides the fastest tools for building apps on every type of Android device.

DOWNLOAD ANDROID STUDIO

4.1 for Mac (878 MB)

RELEASE NOTES

## 2. Install it

- Leave the Android SDK and Android Virtual Device boxes checked -- they are necessary.
- It may take a while for the program to install.

- If asked to import settings from a previous version/setup, ignore and continue with the setup

### 3. Open an existing Android Studio project.

- Open Android Studio and click **“Open an existing Android Studio project”**

- Download the provided codebase. Navigate and select **build.gradle**

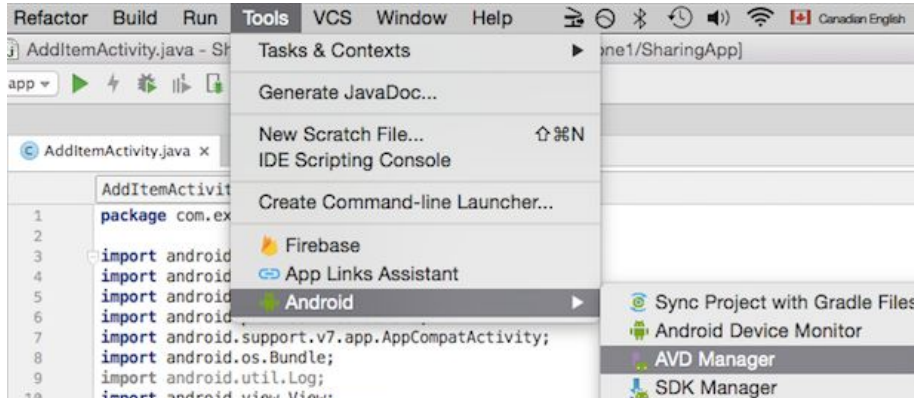

- Once you click **OK** it will start building the project, which may take a few minutes to complete.
- You may need to download or update Java – Android Studio will let you know when you try to build the project.

- Update everything it prompts you to update.

## 4. Create an Android Virtual Device (AVD)

Next you will need to **create an Android Virtual Device (AVD)** i.e., an android emulator.

- Open the AVD Manager: **Tools** → **Android** → **AVD Manager**

- Click **Create Virtual Device**

- Select the any device of your choice - here we use **Pixel 4 XL**; click **Next**

- Select **Q** - API level 29 (Aka Android 10). You may have to download this first and this may take a while.

Release Name	API Level ▼	ABI	Target
<b>R</b>	R	x86	Android 11.0 (Google APIs)
<b>R</b>	30	x86	Android 11.0 (Google APIs)
<b>Q</b>	29	x86	Android 10.0 (Google APIs)
<i>Oreo</i> <a href="#">Download</a>	27	x86	Android 8.1 (Google APIs)
<b>Oreo</b>	26	x86	Android 8.0 (Google APIs)
<i>Nougat</i> <a href="#">Download</a>	25	x86	Android 7.1.1 (Google APIs)
<i>Nougat</i> <a href="#">Download</a>	24	x86	Android 7.0 (Google APIs)
<i>Marshmallow</i> <a href="#">Download</a>	23	x86	Android 6.0 (Google APIs)
<i>Lollipop</i> <a href="#">Download</a>	22	x86	Android 5.1 (Google APIs)

- It will prompt you to give it a name to identify it. The name will have no effect on how the program runs, as long as you know which one you need to run the app.

- Click **Finish** when this is complete.

## 5. Run the App

- Select a virtual device from the drop down menu

- Click the **play button** to run the app.

- The emulator takes a while to load, install and run your app. Be patient!
- Once your emulator finish loading and the app will start:

**Congrats**, you can now start programming in Android Studio! Play around with the app to see how it works!
